

VERDIQ PROJECT EVIDENCE PACKAGE

Deccan Solar Transition Project

Demo / Prototype Evidence Document - for Verdiq workflow demonstration only

Project ID (demo)	Name	Project Type	Location
New project - database assigned	Deccan Solar Transition Project	Renewable Energy	Maharashtra, India
Expected Annual Credits	Developer	Submission Status	Document Purpose
7,500	Demo Developer / Green Future Ltd	Supporting Evidence	Prototype verification

1. Project Overview

The Deccan Solar Transition Project is a demonstration renewable-energy initiative proposed for Maharashtra, India. The project is designed to increase the supply of solar electricity and support a measurable transition away from higher-emission electricity generation.

The project is being submitted through the Verdiq prototype workflow so that project information, evidence, auditor findings, and credit-issuance steps can be demonstrated end-to-end.

Important: This document is a synthetic demonstration artifact. It does not represent a real registered project, an independently validated climate project, or certified carbon credits.

2. Objectives

- Develop solar electricity generation capacity within the proposed project boundary.
- Displace a portion of higher-emission grid electricity with renewable generation.
- Establish a monitoring framework for electricity generation and operational performance.
- Provide auditable project records to support the Verdiq verification workflow.

3. Proposed Project Activities

The demonstration project assumes installation and operation of solar photovoltaic generation assets. The project workflow includes site preparation, equipment installation, commissioning, electricity generation monitoring, maintenance records, and periodic performance review.

4. Monitoring and Evidence Plan

Evidence Area	Proposed Evidence	Review Purpose
Project location	Site identification and project description	Confirm project boundary and location information
Generation data	Meter readings / generation summaries	Evaluate reported renewable electricity generation
Equipment records	Installation and equipment documentation	Confirm consistency of proposed technology
Operational records	Maintenance and operating logs	Support monitoring and continuity assessment
Emission methodology	Documented calculation methodology	Support calculation of estimated emissions reductions

5. Expected Credit Volume

For the Verdiq demonstration, the project has been entered with an expected annual credit volume of 7,500 credits. This figure is a project-submission input only and must not be interpreted as an independently verified issuance quantity.

Credit issuance should occur only after the platform's required review and verification process is completed.

6. Verification Notes for Auditor

The auditor should review the project description and supporting evidence, identify material inconsistencies or missing evidence, record findings, and then approve or reject the submission according to the platform's defined verification workflow.

7. Developer Declaration

The submitting developer confirms, for this prototype workflow, that the information in this evidence package is intended to support demonstration of project registration and verification functionality. All project-specific facts in this document are illustrative.

Document classification: DEMONSTRATION / PROTOTYPE

Prepared for Verdiq application testing and presentation. Not a certification, registry record, or validated carbon-credit issuance document.
