

Konkan Wind Transition Project

Project Evidence and Monitoring Summary

DEMO / PROTOTYPE EVIDENCE

This document is prepared solely for demonstration of the Verdiq project-verification workflow. It is not an actual certification, registry record, or independently verified carbon-credit document.

Project ID	To be assigned by Verdiq
Project type	Renewable Energy - Wind
Location	Maharashtra, India
Project status at submission	Draft / submitted for verification
Expected annual credits	7,500 tCO2e-equivalent units (demo estimate)
Project developer	Demo Developer
Organization	Green Future Ltd

1. Project Overview

The Konkan Wind Transition Project is a demonstration renewable-energy initiative intended to support lower-emission electricity generation through wind power in Maharashtra. The project is structured to illustrate how a developer can submit project information and supporting evidence to Verdiq for independent review.

2. Project Objectives

- Deploy wind-energy generation assets in the identified project area.
- Displace a portion of higher-emission electricity generation with renewable electricity.
- Establish a monitoring and documentation process suitable for review.
- Estimate annual carbon-credit potential using a transparent, documented methodology.

3. Proposed Activities

- Site and resource assessment for wind generation.
- Installation and commissioning of wind turbines and associated electrical infrastructure.
- Operational monitoring of electricity generation and equipment availability.
- Collection of generation records, maintenance logs, and supporting project evidence.
- Periodic reporting for verification and credit accounting.

4. Monitoring and Evidence Plan

Evidence category	Illustrative evidence
Project identity	Project description, site details, developer declaration

Generation	Meter readings, generation statements, operating logs
Equipment	Asset list, commissioning records, maintenance logs
Grid / electricity	Electricity export or consumption records, where applicable
Verification	Auditor findings and approved issuance quantity

5. Preliminary Credit Estimate

For this prototype, the developer proposes an expected annual credit volume of **7,500**. This value is a demonstration estimate only and is not itself evidence of verified emission reductions.

The final issuance quantity should be determined through the Verdiq verification workflow based on supporting evidence and the auditor's approved issuance quantity. The platform should record the developer's expectation separately from the auditor-approved quantity.

6. Developer Declaration

The developer confirms that the information in this demonstration submission is intended to represent a project proposal and supporting evidence package for software testing. Any real-world deployment would require appropriate project documentation, monitoring records, verification, and registry procedures before credits could be considered valid for environmental claims.

Prepared for Verdiq demonstration workflow
