

Project Evidence & Preliminary Monitoring Plan

DEMO DOCUMENT - FOR PROTOTYPE / PRESENTATION USE ONLY

Project ID	2
Project Name	Western Ghats Restoration
Project Type	Reforestation
Location	Maharashtra, India
Developer	Demo Developer
Organization	Green Future Ltd
Expected Annual Credits	5,000
Current Status	Under Review

1. Project Overview

Western Ghats Restoration is a proposed reforestation initiative focused on restoring degraded forest areas in Maharashtra through native tree plantation, biodiversity improvement, and long-term carbon sequestration. The project is being submitted to Verdiq for review and verification before any carbon credits are issued.

The project is currently in the **Under Review** stage. This document is a demonstration evidence package created for the Verdiq prototype and does not represent a certified carbon project or a verified emissions-reduction claim.

2. Project Objectives

- Restore degraded land using locally appropriate native tree species.
- Improve ecological resilience and habitat quality over the project period.
- Increase long-term biomass and soil carbon stocks through reforestation.
- Create a transparent monitoring trail that can be reviewed by an independent auditor.

3. Proposed Project Activities

Activity	Description
Site preparation	Identify eligible restoration areas, document baseline land condition, and prepare planting zones.
Native plantation	Plant locally suitable native species using a site-specific plantation plan.
Maintenance	Protect planted areas, replace failed saplings where required, and manage competing vegetation.
Monitoring	Record plantation area, survival rate, species mix, and periodic biomass indicators.

4. Expected Credit Estimate

The developer has entered an **expected annual issuance of 5,000 carbon credits** in Verdiq. This value is an initial project estimate only. Final credit issuance, if any, would depend on approved methodology, validated project boundaries, monitored activity data, verification findings, and applicable registry rules.

5. Monitoring Plan

Parameter	Evidence / Frequency
Project area	Mapped project boundary and area record; update when project boundary changes.
Planting activity	Planting logs, dates, species mix, and planting records for each restoration block.
Survival rate	Periodic field sampling after planting; record survival and replacement activity.
Biomass indicators	Periodic field measurements and/or accepted estimation methods documented by the project team.
Supporting evidence	Photographs, field notes, invoices, maps, spreadsheets, and relevant project documents.

6. Verification Notes

- No carbon credits have been issued from this project at the time of this document.
- The project is awaiting independent auditor review inside the Verdiq workflow.
- Credit issuance should occur only after satisfactory verification and approval of the relevant evidence.
- Any quantified emissions-reduction claim must be supported by the methodology and source records used for verification.

7. Developer Declaration

The developer confirms that the information in this demonstration package is intended to support a project submission workflow. The document is prepared for prototype demonstration purposes and should not be interpreted as independent validation, certification, or a claim of verified carbon performance.
